Reasons to Vaccinate

Protect your loved ones and those who cannot get vaccinated—your children and those with serious medical conditions remain at risk.

Unvaccinated remain at significant risk: currently 99 % of those hospitalized and 99% of deaths are occurring on unvaccinated.

Vaccine is very effective and protective— 350 million people in the US and more around the world have been vaccinated. Side effects do occur but are rare.

Delta variant is making a surge—NOW is the time to protect yourself against this very contagious and deadly variant before it reaches you!

You cannot tell who has COVID and is likely to pass it on. If your friend or relative has COVID they are MOST contagious the 2 days before having ANY symptoms themselves!!

“I’m young and healthy” “I’ll be fine even if I get COVID”. - That is likely. But long COVID affects all ages, some data suggest more prominent in younger population. There is no “cure” for long COVID.

You cannot get COVID from the vaccine.

Vaccine does not affect fertility for men or women.

Be part of the solution! Do your part—as long as the virus continues to replicate it mutates and forms stronger and more contagious variants. Help STOP the variants!! So we can end this pandemic!!

Will I need a booster shot? MAYBE. Data is looking very promising that the vaccines provide long lasting immunity. But IF a new variant develops which escapes current vaccines we will ALL need a booster shot.
